SOLUTION TO RBAC ASSIGNMENT

1. Roles and permissions is better to use than Roles because when using roles and permission a user will be able to have access to more than one roles unlike roles whereby a user can only access on role.
2. Join table is better than array because it is easier to use in querying efficiently, storing metadata, and referential integrity unlike array which involves doing it manually.
3. Tier field for quotas is separated from access control because tier field is used for quota enforcement which gives users with specific role limited access depending on how they pay.
4. 404 is returned instead of 403 when a user accesses another person document because 404 informs the attacker that the file does not exist unlike 403 that shows that the file exists but cannot be accessed by the attacker.
5. Role assignment and revocation are logged in other to supports generic metadata
6. Permissions are cached in the authorization middleware
7. If a role is deleted, the database automatically removes the UserRole records.
8.
